DATA ANALYTICS

DR. BRENDA MULLALLY

COMMON MATHEMATICAL FUNCTIONS

- Understanding different functional relationships is instrumental in model building. The airline pricing example used a linear function that related price to demand.
  - Linear y=mx+b
  - Logarithmic y=ln(x)
  - Polynomial y=ax^2+bx+c
  - Power y=a^b
  - Expontential y = ab^x

DATA FITTING

- For may applications, functional relationships used in decision models are derived from the analysis of the data.
- The trendline tool provides a method of determining the best fitting functional relationship. Using the trendline tool you can try fitting each function to the data.
- Data fitting is combined with logical approaches in model building.

SPREADSHEET ENGINEERING

- Verification
- Improve the design and format of the spreadsheet itself.
- Improve the process used to develop a spreadsheet.
- Inspect your results carefully and use appropriate tools available in Excel.
  - Use the Data Validation tool
  - Inspect and audit formulas

MODEL ASSUMPTIONS, COMPLEXITY, AND REALISM

- Validity
- All models reflect assumptions used by the modeler.
- Assumptions simplify models and make them easier to manipulate and solve
- Assumptions should be as realistic as necessary to make models useful but not overly complex
- Assumptions should be clearly stated and documented
- To add more realism to a model generally requires more complexity
